Practice: Applying a Filter Effect to Your Photo If Photoshop isn't your thing, you can use Photoshop Elements or Adobe Bridge to create various effects similar to those available in Photoshop. The following steps take you through the process of creating an image with a beautiful blur effect. (For an explanation of how to place a print of this image on a white background and produce the same effect using the Print command, see the steps at the end of this section.) Here are the steps for producing a beautiful blur effect: 1. **Open a photo that you'd like to work on, and then place it on a new layer above the background layer.** 2. **Use the Filter>Distort>Lens Blur menu item to apply the Filter Overlay effect to your image.** 3. **In the Lens Blur dialog box that appears, choose Gaussian Blur.** See Figure 2-7. FIGURE 2-7: Choose a blur filter for the image and then use the Gaussian Blur filter for a smooth, out-of-focus look. As you can see in the figure, you can select the filter you want to use from a drop-down menu. Be sure to look over the options in the Filter Tips dialog box that appears when you start to type a new filter. See Figure 2-8. FIGURE 2-8: The Filter Tips dialog box gives you information about what each filter does. You can fine-tune the effect of the gaussian blur by adjusting the settings in the Lens Blur dialog box. However, if you just want to get in and out of this, you can also change the settings in the Lens Blur dialog box to achieve a similar look. Figure 2-9 shows the Lens Blur dialog box with a subtle white border effect on the main photo layer. FIGURE 2-9: Experiment with the various settings in the Lens Blur dialog box to get a look that's just right. 4. **Repeat Step 2 to create another image.** 6. **Add the second image to the background layer.** If you don't have two copies of the same photo, you can repeat Steps 1 to 6 to create another image, and then add it

The overall goal of this proposal is to identify the physiologic and pharmacologic events in the nucleus that occur in response to restricted sleep and to determine how homeostatic and circadian mechanisms interact with one another to regulate sleep. The focus is on the changes in membrane excitability that occur in the neuromuscular synapses. Preliminary data indicates that both afferent and efferent neurotransmission is altered during sleep deprivation. One hypothesis is that the increased excitability that occurs as a consequence of afferent activation is due to reduced positive feedback of this excitability to the spinal cord. It is proposed that the reduced feedback occurs as a result of the increase in membrane excitability that normally occurs in the afterdepolarization following muscle fiber action potentials. This decrease in feedback may in part be due to the insertion of Na⁺-sensitive K⁺-channels into the membranes of motoneurons. This hypothesis is supported by recent electrophysiological studies that demonstrate that afferent depolarization (which is an inhibitory input) is reduced during sleep deprivation and that cholinergic activation of the neuromuscular junction can block the generation of afterdepolarizations. Two behavioral models will be used to assess the synaptic effects of sleep deprivation. One is the cat behavioral model and the other is the primate model. These models possess a number of advantages since they are easily utilized, the protocols are easily understood, and allow for the replication of drug administration during sleep deprivation. The significance of the proposed studies is that the fundamental information obtained here will be applied to the understanding of human sleep disorders. Studies are designed to determine if sleep deprivation influences the cholinergic, noradrenergic and histaminergic inputs to the neuromuscular junction and to the spinal cord, to determine if the physiological and pharmacological responses of the spinal neuromuscular synapse are altered in response to sleep deprivation, and to determine if specific drugs commonly used to treat various sleep disorders alter the afferent and efferent synaptic function. Make sure you are using the necessary amount of lime juice. I use fresh lime juice instead of bottled juice. You want the juice to come out of the lime in a cloud. Try this for taco night. I don't really care for ice cubes. I always have my blender on as I make these and am blending away. Use a fresh piece of lime each time. Sometimes the can messes up the flavor. I've used frozen citrus, but still enjoy fresh.

Effect of bisoprolol on exercise performance in patients with coronary artery disease. To evaluate the effect of the beta 1-selective cardioselective beta-blocker bisoprolol on exercise tolerance in patients with coronary artery disease (CAD), 17 patients received 1 mg bisoprolol twice daily, 17 patients 1 mg bisoprolol twice daily plus placebo, and 17 patients 1 mg bisoprolol twice daily plus calcium-antagonist (300 mg of amlodipine) in a randomized, double-blind, placebo-controlled study. The bisoprolol and amlodipine group showed significantly greater decreases in mean heart rate (69.1 vs 70.0 bpm, P Top Ten Unexplainable Things Reported In Your Cases
